Navy Case No. 72939

CLOSED BRAYTON CYCLE DIRECT CONTACT REACTOR/STORAGE TANK

WITH O₂ AFTERBURNER

ABSTRACT OF THE DISCLOSURE

A closed cycle Brayton direct contact reactor/storage tank uses an afterburner to assist in removing metal vapors from the working fluid. The direct contact reactor/storage tank operates by bubbling an inert gas through liquid metal fuel. The inert gas picks up metal vapors from the fuel. The afterburner comprises a predetermined amount of oxygen, O2, being fed to a filter cavity within the reactor/storage tank and having the metal vapors react directly with the O2 forming a solid oxide that remains and does not circulate as part of the working fluid throughout the external parts of the Brayton cycle outside of the reactor/storage tank causing damage to system components.
